

Report on HFR - Ibiza Historical data files QA/QC

Data provider information:

- contributors name: Guiomar López
- contributors contact: hfr_ibiz@socib.es
- acknowledgements: Ministerio de ciencia e innovación, Govern de les Illes Balears , Consejo Superior de Investigaciones Científicas (España) -10.13039/501100003339, The network has been designed, implemented and managed through the efforts of SOCIB. The datasets collected were partially supported by the Jerico Next (H2020) and CMEMS-SE and INCREASE projects

System: **Ibiza**

Sites: **FORM, GALF**

Data set: **Totals**

Data source: Totals from the radials combination in de EU Node

Period: **2012-Jun-01 - 2022-Dec-31**

Map of the HFR-NAdr network area. Red dots indicate the position of the sites

Daily data % available during the whole time period

INFO ON QA/QC Settings and Calibration

%%% QC info for all the period 01-Jun-2012 – 31-Dec-2022

OceanSITES quality flagging for GDOP threshold QC test. Threshold set to 2.83

OceanSITES quality flagging for Data density threshold QC test. Threshold set to 3 radials.

OceanSITES quality flagging for Velocity threshold QC test. Threshold set to 0.7 m/s.

OceanSITES quality flagging for variance threshold QC test. Test not applicable to Direction Finding systems. The Temporal Derivative test is applied. Threshold set to 1 m/s.

%%% Calibration info

GALF: 2015-08-18T00:00:00Z;

FORM: 2017-01-26T00:00:00Z

GALF: 2018-11-14T00:00:00Z;

FORM: 2018-11-15T00:00:00Z;

FORM: 2020-03-03T00:00:00Z;

Inconsistencies between the information provided in the header of the radials and the dates of the last calibration performed. This problem is being analysed with the data provider

RESULTS OF HIST DATA INSPECTION

General comments:

We have noticed 3 periods to be controlled and/or reflagged, occurring in:

2013, 2015, 2018

(to be changed after control only if flag is not yet equal to 0 or 4)

High mean current values and standard deviation.

year	General comment	Periods to be reflagged	Reason for new fagging	Sugg. Flag
<u>2013</u>		01-Feb-2013 – 20-mar-2013	high std variability low data availability	2
<u>2015</u>		14-Jan-2015 – 23-Jan-2015	high std variability isolated data period	3
<u>2018</u>		21-Jan-2018 – 22-Feb-2018	high std variability low data availability isolated data period	3

After exchanges with the provided the following periods where reflagged:

Year	General comment	Periods to be reflagged	Reason	New Flag
<u>2013</u>		01-Feb-2013 – 20-mar-2013	Observations > Incidence in GALF (Ibiza Radial site) [22/01/2013-20/03/13]. Increase of reflected power from 1 to 6 W; change in loops phase; error related to the 13.5 MHz CODAR SeaSonde antenna design	3

			Consequences > Radial vector count reduction Actions required > Change to A4-AISI 316 Stainless Stell Dome Nut and Calibration of the station in April	
2015		14-Jan-2015 – 23-Jan-2015	Observations > Incidence in FORM (Formentera Radial Site) [09/01/2015-21/02/2015]. Communication outage and hardware (macmini) outage. Consequences > Radial data loss Actions required > Reparation of WIMAX antenna and installation of a new macmini configured with SS Radial Suite R7	3
2018		21-Jan-2018 – 22-Feb-2018	Observations > Incidence in FORM related to the failure of the AWG module (PPS signal problems; spectrac acquisition restarted every 15 seconds) ; Incidence in GALF related to frequent AC power outage Consequences > No generation of spectra, nor radials Actions required > change the AWG module in FORM	3

Spatial Coverage vs. Temporal coverage: objective of USCG 80-80% data availability			
Period	General comments	Nb. analysed hours	80%-80% obj.
2012	89.5652% spatial availability 80% of the time.	5136	y
2013	89.1304% spatial availability 80% of the time.	8757	y
2014	89.1304% spatial availability 80% of the time.	8760	y
2015	89.5652% spatial availability 80% of the time.	8756	y
2016	90.4348% spatial availability 80% of the time.	8784	y
2017	13.6957% spatial availability 80% of the time.	8681	n

2018	82.1739% spatial availability 80% of the time.	8756	y
2019	90.4348% spatial availability 80% of the time.	8760	y
2020	71.7391% spatial availability 80% of the time.	8751	n
2021	70.6522% spatial availability 80% of the time.	8352	n
2022	67.6087% spatial availability 80% of the time.	8241	n

Annex I Applied QA/QC tests

QC Flag Variable name	Short name	Short description
-	Syntax	Syntax check: this test will ensure the proper formatting and the existence of all the necessary fields within the total NetCDF file. This test is performed on the NetCDF files and it assesses the presence and correctness of all data and attribute fields and the correct syntax throughout the file. This test is performed by the European HFR Node before pushing data to the distribution platforms.
DDNS_QC	Data Density Threshold	Data Density Threshold: this test labels total velocity vectors with a number of contributing radials bigger than the threshold with a “good data” flag and total velocity vectors with a number of contributing radials smaller than the threshold with a “bad data” flag.
CSPD_QC	Velocity Threshold	Velocity Threshold: this test labels total velocity vectors whose module is bigger than a maximum velocity threshold with a “bad data” flag and total vectors whose module is smaller than the threshold with a “good data” flag.
VART_QC	Variance Threshold	Variance Threshold: this test labels total vectors whose temporal variance is bigger than a maximum threshold with a “bad data” flag and total vectors whose temporal variance is smaller than the threshold with a “good data” flag. This test is applicable only to Beam Forming (BF) systems. Data files from Direction Finding (DF) systems will apply instead the “Temporal Derivative” test reporting the explanation “Test not applicable to Direction Finding systems. The Temporal Derivative test is applied.” in the comment attribute.
TIME_QC	Temporal Derivative	Temporal Derivative: for each total bin, the current hour velocity vector is compared with the previous and next hour ones. If the differences are bigger than a threshold (specific for each grid cell and evaluated on the basis of the analysis of one-year-long time series), the present vector is flagged as “bad data”, otherwise it is labelled with a “good data” flag. Since this method implies a one-hour delay in the data provision, the current hour file should have the related QC flag set to 0 (no QC performed) until it is updated to the proper values when the next hour file is generated.
GDOP_QC	GDOP Threshold	GDOP Threshold: this test labels total velocity vectors whose GDOP (Geometrical Dilution Of Precision) is bigger than a maximum threshold with a “bad data” flag and the vectors whose GDOP is smaller than the threshold with a “good data” flag.
QCflag	Overall QC	

Annex II QC Flags

Code	Meaning	Comment
0	No QC was performed	-
1	Good data	All real-time QC tests passed.

2	Probably good data	-*
3	Bad data that are potentially correctable	These data are not to be used without scientific correction.*
4	Bad data	Data have failed one or more of the tests.
5	Value changed	Data may be recovered after transmission error.
6	Not used	-
7	Nominal value	-
8	Interpolated value	Missing data may be interpolated from neighbouring data in space or time.
9	Missing value	-

*These two are to be used after examination of the hist data sets and exchanges with the data provider

Annex III Figures for the QA/QC tests

Fig A – Temporal series of the spatial average of the current velocity module (first panel), its standard deviation (second panel), the grid points of the total coverage (third panel), and monthly data availability. Black dots are the values obtained considering all the data in the domain, in green those considering only data with QC flag =1 (good data).

Fig B - Temporal series of the QC flags for all the grid nodes with data and percentage of data with each flag (0,1,2,3,4).

Fig C - Maps of the mean velocity module and the mean value of QC flags for the target year (left column) and their standard deviations (right column) for the target year.

Fig D - Spatial (x-axis) vs. temporal (y-axis) coverage 80/80 annual metric. Allows to check if the system has reached the goal of providing surface currents over the 80% of the area during 80% of the time. The grid points taken in account for the % are the ones inside the GDOP limits defined by the data provider.

Fig E – Map of the % of availability of data in each grid point and contour showing the area of temporal availability >80%

Fig F- Mean surface current maps for the indicated systems and periods. The means are computed in the area of 80% temporal coverage for the target year.
